

Autism, Primitive Rebellion Against Authoritarian Theocratism – Family Education, Alpha Emitting Nanoparticulates and Bigotries

Florent Pirot

Independent researcher

ABSTRACT

While it has been shown earlier that alpha emitters are a founding factor in autism, there is another factor related to societal organization, with parental control on children inspired by authoritarian religions being a major complementary element in the emergence of the disease. Catholic principles in particular appear extremely related to it, and this can be demonstrated in many ways. In general, the abnormality of the familial order creates reactions in children, which reintroduce some of the naturality forgotten, as fine (toll) for their parents. All authoritarian theocratic societal organizations create issues in family education that spill into autism in children as protective reaction.

Keywords: Autism, Autism spectrum disorders, ASD, Epidemiology of autism, Autism prevention, Neuropsychopathology

INTRODUCTION

The discovery of the Asperger's syndrome in Austria in 1944 is the first testimony of the theorem developed in this article, that can be related to Nazism being in a certain way a guarantee of Catholicism, with many Catholic priests having supported the Nazis as they went East during the Barbarossa offensive in particular. The second testimony is the demonstration of the high prevalence of autism in Northern Portugal in [1]. The discovery of a new syndrome is simply a marker of emergence of a new disease, that shows its emergence. Portugal has a strong Catholic clergy and its North is rich in alpha emitters because of its granitism.

ANALYTICAL OBSERVATION

The study of Leo Kanner [2] starts in 1938. At this time a Nazi party had significant influence in the USA, and this is when the first child is diagnosed by Kanner, indicating a similar tendency. It was shown in [3] how intermediate to high levels of contamination with alpha emitters are related to emergence of Nazi views during periods of demographic transition. Kanner's study shows how children react naturally to problems of natural justice. For instance, the fate of animals (the term "piggy-back" creating a reaction to the fifth subject) and some early references to Nazi camps (with "Dora" for the second subject – although it is the mother's name it is possible to consider the ability to pronounce that before age 2 to be very significant), as well as perhaps a will to nurture forest growth with defecation for the third subject, son of a forest scientist. There are arguments supporting the idea that children simply try to help their parents, as they can see principles of natural justice, though sometimes authoritarian religious education, typically under influence of certain religions, such as Catholicism, create a natural opposition because children do not adhere to the discrimination principles that many parents in these areas teach to them. In [4], an epidemiology of autism reinforces these arguments. The

relatively high rate in Poland and the superiority of the rate in Sweden in comparison with Finland are two demonstrations. Atheism in Finland is quite widespread and attendance to the Lutheran national church very low. This compensates the effects of granitism. Atheism in Sweden is less frequent than in Finland [5]. This brings forward a similar explanation for likewise moderate results of autism in both Russia (as late result of the anti-religious policies of the CPUS), Ukraine and China, as opposed to Japan. Whereas inbetween Canada and the USA the higher results of autism in Canada seem to result of the higher natural radioactivity in Canada, inbetween Mexico and the USA the effects of Catholicism in Mexico explain their higher rate (nearing Sweden's) in comparison with the USA.

DISCUSSION

Another study [6] shows a lower rate in Ultra Orthodox Jews and in Arabs relative to the general population in Israel. It somehow confirms statistically the dangerousity of Catholicism and of the other authoritarian theocratic religions, with Arabs in Israel benefitting fully from the relative separation from other Muslims being an element to allow qualifying as well Islam (from the data in [4]), whereas there remains a discussion with solar radiation and fertile alpha emitters in particular pushed down in the body.

Radical Christianity tends to encourage self-assimilation to Jesus by believers, self-crucifying in the carrying of their own cross, keeping alpha emitters within themselves for instance, to secure in themselves cognition difficulties helping them feel better in the anti-scientific political environment that Christianity fosters. Autism in some children is hence a lifebuoy for society in this context. This is why these children are found with qualities related to scientific observation. This is already visible in the study by Leo Kanner ([2]). The relation of Catholicism to the body, its development of body control ("biopouvoir" to use the French word of Michel Foucault) in relation to sexuality, is also part of what children reject through autism. It is for instance possible to argue that in 2003 couples having children in France statistically have benefitted from the arrival of the right-wing majority to make their children. The Raffarin prime ministership was particularly carried by Catholicism. In [7], lower rates of children with autism in the 1997 batch than in the 2003 batch are found but this is easily explained by Edouard Balladur's liberal heritage and Lionel Jospin's protestantism-trotskyism. The very high autism rate in Maryland in the USA, one of the top three in the USA along with Florida and Rhode Island [8] is also a clear consequence of statization of the belief in the Virgin Mary in that state¹. It has to be noted that some discriminatory factors should be integrated in the case of the USA. In particular the swine flu vaccine experiment. Reading [9] leads to the conclusion that a mythridatization experiment with low doses of depleted uranium in vaccines on 49 millions of Americans was attempted under cover of the swine flu vaccine, at the peak of the Cold War. It is clearly syringue injection failures, with syringues reaching into the bone, that have to be related to the syndromes reported in patients with ill aftereffects, especially neurological (on Guillain-Barré syndrome, see [10]). This conclusion results from an in-between-the-lines interpretation of the book, which does not explicitly mention depleted uranium². Though it is clear, with the harassment measures reported against some laboratory members in the

1 Which had specific anti-Quaker laws in its history, for instance.

2 Whereas it seems the work of the author of this article was read by the author of the book but not included in the bibliography... the focuses of the book show implicit acknowledgement that depleted uranium is the key.

framework of that large operation on the public, that it was a mythridatization attempt against the threat of Soviet nuclear bombs, and national security to protect it.

As concerns Islam, the data in [4] shows tragic autism levels in countries where the religion is strongest, such as Saudi Arabia and Oman. This may also be related to some side effects such as smokes with alpha emitters from India and the kinetic spin of the Earth for Oman, which has an higher rate than Saudi Arabia (also discussed in [10] regarding radium in oil). Data on rising cases of traumatic brain injury [11] and of spina bifida in Mali [12] (with rises after the strikes in 2013 (72 cases over the period 1 January 2018 to 31st December 2019, as opposed to a rate of 32,9 cases per year in the period 1990 to 2000 in which some positive push effect from depleted uranium use in military exercises in Somalia onto sedimentary uranium in central Africa has to be accounted for as well)), suggest a contribution of depleted uranium there, for the rate of 4,5%, reported in [13] and [14] for the period between 2017 and 2019 – the prevalence is of 1-2% worldwide [14]. Acute lymphoblastic leukemias are also found having a very poor prognosis rate in Mali, with a global survival of 6% [15]. The pictured case of the throat gloat in a young male adolescent in that article relates most likely to forced fellatio imposed by some male in the context of the climate of latent homosexuality bred by alpha emitters under the sun (see [16]). There seems to be a relationship to Islam, to radical Christianity, or to African voodoo-like practices of “black magic”, in the case clearly related to pedophilia, which is a strong indirect factor in the “biopouvoir” issues of authoritarian theocratism.

CONCLUSION

Whereas Hitlerism itself, as secret cult, can be considered an authoritarian theocratism, with pedophilia intense within, Catholicism and radical Christianity in general as well as some Jewish non-Orthodox currents and most Islamic schools together with all bigotries represent a quintessential epidemiological factor in the prevalence of autism, though initial levels of contamination with alpha emitters contribute to the encroachment of these pyramidal systems not recognizing individual independence (typically through cultivation of the need for community interpretation of religious texts) to the believer. Parents in these cultures tend, when they are radicals, to push it into their children and sometimes “into their children’s throats” takes a very direct meaning.

Children react to parental pressure and counterbalance it when it is beneficial to humanity as a whole. Autistic children are a safety siren for pressurized societies. It is difficult nevertheless to face the case of parents radicalizing in isolated communities (bubbles), in particular when children are even cut from access to internet networks, without some recourse to principles of common sense, with “bubble popping” as universal recommendation of the author.
