

General Physics of “Mystical Face Apparitions” – Why People Come to Believe in Hypothetical “Virgin Mary or Jesus Faces”

ABSTRACT

The various natural disasters involving forms of sedimentation explain concretion of face remains on tufs that can later happen to be found by humans or even be accidentally taken by industrial works and reappar randomly. One case is given. Frequent apparition of such remains have obviously spread, in other groups of people the feeling of divine signs, “apparition of the Virgin Mary” for instance in recent times. Already existing articles of the author demonstrate how natural disasters happen against tribes and groups that have not followed natural rules but have become exploitative, explaining why archaeological work is not extremely interesting.

Keywords: Geophysics, astrophysics, archaeology, divinity studies

1 Introduction

The finding by the author on his own terrasse (see Appendix) a few days after novel Pompeii findings propped an immediate conclusion. The prolegomena implies reading [1] and [2] on the details of fireball events which for the nature of this particular “face impress” appear the most likely, a person standing in a relatively dense area, the geology quite uranium-rich and a city that developed upon it, exploitatively (see [2] in particular for the theorem). The fireball creates a phenomenon akin to shadow impressions during Hiroshima, later filled with slightly more water (hence darker side behind) and other materials fall back into the hole just carved by that fireball, the matter is compressed and thousands of years later an industrial activity of stone excavation slices through it.

2 Discussion

Is there another conclusion possible on the case study ? The fireball hypothesis could be put in competition with the pyroclastic cloud hypothesis in a volcanic area that would have produced boxing-type deaths followed by later water sediments injecting new materials into the light tufs before quarry works. There nevertheless is a feeling of brutality in the event associated with that case where an atomic flash from a fireball literally squeezing the body onto the sides of a big blocks of buildings themselves made of quite dense materials (of course) followed by slow sedimentation is the surest answer.

The fireball events on the history of the Earth are numerous. Before humans agglomerated in primitive cities, as they were still hunter-gatherers granitic areas were the main natural beacon for the fireballs due to natural density underground explaining rise of dolmens and even of some menhirs through lateral crush and rock bouncing to form bizarre structures sometimes (frequently) of a chapiteau-like shape, especially with fireballs impacting diagonally (in vertical impacts menhir formation ensues),

areas later colonized (used for stoves...) and rearranged by humans. A rapid study suggests a typical presence of double dolmens in a ratio of around 15 to 20% in conformity with U236 theorem underlined in [1] and again demonstrated in [2]. Some menhir areas show the rebound effect from direct fireball impact, vertically, however humans later imitated the custom and carved similar stones.
